

AXIOM PROTOCOL

Tokenomics

AXM supply, issuance, founder vesting, fee policy, reserve design, and year-101 sustainability.

Trust Mathematics, Not Power.

Draft v0.1 | 2026-05-12 | Phase 0 Specification

Native coin

AXM is the native coin of Axiom. It is used for transaction fees, validator staking or bonding, settlement, smart-contract execution, Pulse Layer 2 settlement, AI-agent spending limits, and security-service payments.

Supply schedule

Maximum supply: 100,000,000 AXM. Annual emission target: 1,000,000 AXM. Emission period: 100 years. After year 100: no new mint. This creates predictable supply without central-bank style discretionary expansion.

Emission math

Issuance should be defined by deterministic epochs rather than ambiguous wall-clock time. Each epoch receives a fixed reward budget derived from the annual target.

Example if block time = 10 seconds:
 blocks_per_year approximately 3,153,600
 reward_per_block approximately 0.317097 AXM

Example if block time = 12 seconds:
 blocks_per_year approximately 2,628,000
 reward_per_block approximately 0.380518 AXM

Example if block time = 15 seconds:
 blocks_per_year approximately 2,102,400
 reward_per_block approximately 0.475647 AXM

Founder allocation

Founder Allocation: 1,000,000 AXM, equal to 1% of max supply. It is locked for 10 years. From years 11 to 20 it unlocks 100,000 AXM per year, or preferably monthly to smooth market impact. It has permanently disabled voting power and no administrative privileges.

Founder allocation rules:

- years 0-10: 100% locked
- years 11-20: unlock 10% per year
- voting power: permanently disabled
- early unlock: impossible
- admin override: impossible
- contract address: public and immutable

Fee and reserve policy

Axiom should avoid aggressive burn. Burn can reduce spam, but too much burn can shrink long-term circulation. A small burn plus Commons Reserve better supports long-term security.

Recommended fee split for discussion: 75%Reward Pool, 20%Commons Reserve, 5%Minimal Burn. These operational percentages may be tuned by governance, but max supply and emission rules remain immutable.

Commons Reserve

Commons Reserve is a protocol-level reserve used for security, audits, bug bounties, client diversity, public goods, and year-101 validator support. It must not become a central bank. Reserve usage should require transparent proposals, timelocks, public reporting, and anti-capture rules.

Year-101 economy

After emission ends, validator security must be funded by real demand: L1 fees, smart-contract gas, Pulse settlement fees, data availability fees, AI-agent transaction volume, fraud-proof rewards, and Commons Reserve support. The protocol should simulate low-usage scenarios before mainnet.

Disclaimer

This document is a Phase 0 research and design specification. It is not investment advice, legal advice, security assurance, or a promise that the system is feasible without further research, simulations, audits, and testnet validation.
